Mobile Robot Localization and Map Building: A Multisensor Fusion Approach

Jose A. Castellanos, Juan D. Tardós

Mobile Robot Localization and Map Building: A Multisensor Fusion Approach Jose A. Castellanos, Juan D. Tardós

During the last decade, many researchers have dedicated their efforts to constructing revolutionary machines and to providing them with forms of artificial intelligence to perform some of the most hazardous, risky or monotonous tasks historically assigned to human beings. Among those machines, mobile robots are undoubtedly at the cutting edge of current research directions. A rough classification of mobile robots can be considered: on the one hand, mobile robots oriented to human-made indoor environments; on the other hand, mobile robots oriented to unstructured outdoor environments, which could include flying oriented robots, space-oriented robots and underwater robots. The most common motion mechanism for surface mobile robots is the wheel-based mechanism, adapted both to flat surfaces, found in human-made environments, and to rough terrain, found in outdoor environments. However, some researchers have reported successful developments with leg-based mobile robots capable of climbing up stairs, although they require further investigation. The research work presented here focuses on wheel-based mobile robots that navigate in human-made indoor environments.

The main problems described throughout this book are:

- Representation and integration of uncertain geometric information by means of the Symmetries and Perturbations Model (SPmodel). This model combines the use of probability theory to represent the imprecision in the location of a geometric element, and the theory of symmetries to represent the partiality due to characteristics of each type of geometric element.
- A solution to the first location problem, that is, the computation of an estimation for the mobile robot location when the vehicle is completely lost in the environment. The problem is formulated as a search in an interpretation tree using efficient matching algorithms and geometric constraints to reduce the size of the solution space.
- The book proposes a new probabilistic framework adapted to the problem of simultaneous localization and map building for mobile robots: the Symmetries and Perturbations Map (SPmap). This framework has been experimentally validated by a complete experiment which profited from ground-truth to accurately validate the precision and the appropriateness of the approach.

The book emphasizes the generality of the solutions proposed to the different problems and their independence with respect to the exteroceptive sensors mounted on the mobile robot. Theoretical results are complemented by real experiments, where the use of multisensor-based approaches is highlighted.

From reader reviews:

Nellie Davis:

Book is to be different for each grade. Book for children right up until adult are different content. We all know that that book is very important for all of us. The book Mobile Robot Localization and Map Building: A Multisensor Fusion Approach seemed to be making you to know about other expertise and of course you can take more information. It is very advantages for you. The publication Mobile Robot Localization and Map Building: A Multisensor Fusion Approach is not only giving you more new information but also for being your friend when you sense bored. You can spend your own personal spend time to read your reserve. Try to make relationship while using book Mobile Robot Localization and Map Building: A Multisensor Fusion Approach. You never truly feel lose out for everything when you read some books.

Emily Walker:

Information is provisions for people to get better life, information nowadays can get by anyone from everywhere. The information can be a know-how or any news even an issue. What people must be consider any time those information which is within the former life are challenging to be find than now could be taking seriously which one works to believe or which one often the resource are convinced. If you have the unstable resource then you buy it as your main information there will be huge disadvantage for you. All those possibilities will not happen within you if you take Mobile Robot Localization and Map Building: A Multisensor Fusion Approach as your daily resource information.

Margie Sutton:

The book with title Mobile Robot Localization and Map Building: A Multisensor Fusion Approach contains a lot of information that you can understand it. You can get a lot of benefit after read this book. That book exist new information the information that exist in this publication represented the condition of the world at this point. That is important to yo7u to be aware of how the improvement of the world. This book will bring you inside new era of the syndication. You can read the e-book on your smart phone, so you can read that anywhere you want.

Patricia Humes:

This Mobile Robot Localization and Map Building: A Multisensor Fusion Approach is great reserve for you because the content which can be full of information for you who always deal with world and get to make decision every minute. This kind of book reveal it data accurately using great organize word or we can declare no rambling sentences in it. So if you are read that hurriedly you can have whole details in it. Doesn't mean it only will give you straight forward sentences but challenging core information with attractive delivering sentences. Having Mobile Robot Localization and Map Building: A Multisensor Fusion Approach in your hand like finding the world in your arm, details in it is not ridiculous a single. We can say that no e-book that offer you world throughout ten or fifteen minute right but this reserve already do that. So , this

really is good reading book. Hey there Mr. and Mrs. active do you still doubt this?
